# TRAFFIC VOLUMES 1971 ON THE KING'S HIGHWAY AND SECONDARY HIGHWAYS

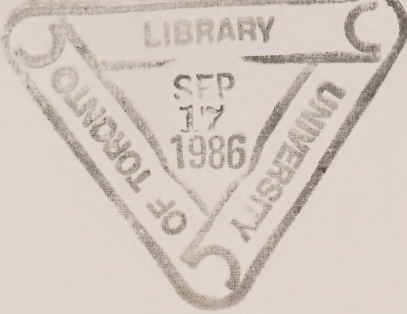

ONTARIO

Ministry

of

Transportation and Communications

## FOREWORD

The traffic volumes listed in this booklet are the Annual Average Daily Traffic (A.A.D.T.), Summer Average Day Traffic (S.A.D.T.) and Summer Average Weekday Traffic (S.A.W.D.T.) figures for each of the sections of highway identified. They represent the total two-way traffic volumes occurring in 24 hours on the average day of the whole year.

Local conditions may cause variations in the volume within the sections of highway listed, but on the whole these sections are considered to be adequately represented by the volumes shown.

Seasonal fluctuations of traffic occur on almost all sections of highway usually resulting in higher traffic volumes in summer and lower traffic volumes in winter. The amount of variation varies considerably from section to section, from highway to highway and from area to area. It is not possible to list all these variations for every section of highway and they are mentioned here only to add to the understanding of the A.A.D.T. volumes given.

In a very general way, traffic volumes in Ontario are growing at the rate of about 5% per year. Obviously, local conditions will cause varying rates of growth to occur in different areas.

TRAFFIC VOLUMES 1972  
ON THE KING'S HIGHWAY  
AND SECONDARY HIGHWAYS

ministry  
of  
transportation and communications

## FOREWORD

The traffic volumes listed in this booklet are the Annual Average Daily Traffic (A.A.D.T.), Summer Average Daily Traffic (S.A.D.T.) and Summer Average Weekday Traffic (S.A.W.D.T.) figures for each of the sections of highway identified.

Definitions of these terms are as follows:

- A.A.D.T. - total two way daily traffic past a given point divided by the number of days in the year.
- S.A.D.T. - total two way daily traffic during the months of July and August, including weekends, divided by 62.
- S.A.W.D.T.- total two way daily traffic during July and August excluding the weekend, divided by the number of weekdays, the weekend being from Friday noon to Monday noon.

Local conditions may cause variations in the volume within the sections of highway listed, but on the whole, the sections are considered to be adequately represented by the volumes shown.

Seasonal fluctuations of traffic occur on almost all sections of highway, usually resulting in higher traffic volumes in the summer and lower traffic volumes in the winter. The amount of variation varies considerably from section to section, from highway to highway and from area to area. It is not possible to list all these variations for every section of highway and the A.A.D.T., S.A.D.T. and S.A.W.D.T. are given as an indication of the magnitude of fluctuations and are shown to provide additional information on traffic patterns and seasonal variations on each section.

In a very general way, traffic volumes in Ontario are growing at the rate of about 5% per year. Obviously, local conditions will cause varying rates of growth to occur in different areas.

# TRAFFIC VOLUMES 1973 ON THE KING'S HIGHWAY AND SECONDARY HIGHWAYS

Ontario

Ministry of  
Transportation  
and  
Communications

## FOREWORD

The traffic volumes listed in this booklet are the Annual Average Daily Traffic (A.A.D.T.), Summer Average Daily Traffic (S.A.D.T.) and Summer Average Weekday Traffic (S.A.W.D.T.) figures for each of the sections of highway identified.

Definitions of these terms are as follows:

- A.A.D.T. - total two way daily traffic past a given point divided by the number of days in the year.
- S.A.D.T. - total two way daily traffic during the months of July and August, including weekends, divided by 62.
- S.A.W.D.T.- total two way daily traffic during July and August excluding the weekend, divided by the number of weekdays, the weekend being from Friday noon to Monday noon.

Local conditions may cause variations in the volume within the sections of highway listed, but on the whole, the sections are considered to be adequately represented by the volumes shown.

Seasonal fluctuations of traffic occur on almost all sections of highway, usually resulting in higher traffic volumes in the summer and lower traffic volumes in the winter. The amount of variation varies considerably from section to section, from highway to highway and from area to area. It is not possible to list all these variations for every section of highway and the A.A.D.T., S.A.D.T. and S.A.W.D.T. are given as an indication of the magnitude of fluctuations and are shown to provide additional information on traffic patterns and seasonal variations on each section.

In a very general way, traffic volumes in Ontario are growing at the rate of about 5% per year. Obviously, local conditions will cause varying rates of growth to occur in different areas.
